The term bioadhesion commonly defined as adhesion between two materials where at least one of the materials is of biological origin. In the case of bioadhesive drug delivery system, bioadhesion often refers to the adhesion between the excipients and biological tissue.

BIOADHESIVE DRUG DELIVERY SYSTEMS

The bioadhesive coated system when comes in contact with the mucus layer, various non-specific or specific interactions occurs between the complimentary structures and these interactions last only until the turnover process of mucin the drug delivery system should release its drug contents during this limited adhesion time, in order for a bioadhesive system to be successful.

CONCLUSIONImprovements in bioadhesive-based drug delivery and, in particular, the delivery of novel, highly-effective and mucosa-compatible polymer, are creating new commercial and clinical opportunities for delivering narrow absorption window drugs at the target sites to maximise their usefulness. Mucoadhesive drug delivery systems are being studied from different angles, including development of novel mucoadhesives, design of the device, mechanisms of mucoadhesion and permeation enhancement.

Bioadhesion may be defined as the state in which two materials, at least one of which is biological in nature, are held together for extended periods of time by interfacial forces. The rationale being that the formulation will be 'held' on a biological surface for localized drug delivery. The API will be released close to the site of action with a consequent enhancement of bioavailability. It is a phenomenon of interfacial molecular attractive forces
