Solved Problems in Classical Mechanics $v(t) = dr(t) dt$, (1) and the acceleration $a(t)$, which is the time rate of change of the velocity, $a(t) = dv(t) dt$. (2) It follows from (1) and (2) that the acceleration is also the second derivative $a = d^2r dt^2$. (3) Sometimes use is made of Newton's notation, where a dot denotes differentiation with

For holonomic constraints introduce generalized coordinates. Degrees of freedom are reduced. Use independent variables, eliminate dependent coordi-nates. This is called a transformation, going from one set of dependent variables to another set of independent variables. Generalized coordinates are worthwhile in problems even without constraints.

[Solution manual] classical mechanics, goldstein
This first course in the physics curriculum introduces classical mechanics. Historically, a set of core concepts—space, time, mass, force, momentum, torque, and angular momentum—were introduced in classical mechanics in order to solve the most famous physics problem, the motion of the planets. The principles of mechanics successfully described many other phenomena encountered in the world.
