We will use special formulas for special types of problems: Theorem. ( TYPE I. Integral from a rational function in sin and cos.) If  $Q(a;b)$  is a rational function of two complex variables such that for real  $a,b$ ,  $a^2 + b^2 = 1$  is  $Q(a;b)$  nite, then the function  $T(z) := Q z^4 - 1 = z^2; z^2 - 1 = 2z^2 = (iz)$  is rational, has no poles on the real line and  $Z^2 \neq 0$

For complex problems, Solver can generate multiple solutions. You then can save these solutions under different scenarios, as described later in this chapter. Solver is a powerful tool that most Excel users don't need. It would be overkill, for example, to use Solver to compute net profit given fixed revenue and cost figures.

Derivation. We know (from the Trivial Inequality) that the square of a real number cannot be negative, so this equation has no solutions in the real numbers However, it is possible to define a number,  $i$ , such that  $i^2 = -1$ . If we add this new number to the reals, we will have solutions to  $x^2 + 1 = 0$ . It turns out that in the system that results from this addition, we are not only able to find the solutions of but ...
