investigation of quantum many-particle systems. The focus is on models of strongly correlated electron systems (Hubbard model, single-impurity Anderson model) and quantum spin models (Heisenberg model, Kitaev model). The physical phenomena (Mott transitions, Kondo physics, spin liquid physics, etc.) these models are supposed to describe, are quite often out of the reach of analytical techniques - this triggered the development ...

Computational physics is the subject that deals with these numerical approximations: the approximation of the solution is written as a finite (and typically large) number of simple mathematical operations (algorithm), and a computer is used to perform these operations and compute an approximated solution and respective error.

The history of elementary particle physics is only 100 years old. J. J. Thomson discovered the electron in 1897 and the electron remains the prototype of an elementary particle, while many other particles discovered between then and today have lost that status. Soon came the Rutherford atom and the nucleus and the Bohr quantization.
