Designing Pid Controller For Dc

Design a PID controller for a DC motor modeled in Simulink ®. Create a closed-loop system by using the PID Controller block, then tune the gains of PID Controller block using the PID Tuner. In this demonstration you will see how to quickly tune the PID controller for a planned model in Simulink. In this particular case, we model the DC motor.

Buy an LM629 precision motor control chip for \$30. This chip does full PID control of position, velocity and acceleration. Requires ~15 lines of I/O to talk to it, and takes about 75-100mA of current just to run this chip. Need to design your own board to mate it to an H-Bridge circuit and a master processor such as a PIC or large Stamp.

This paper considers the design of a robust PID controller for higher order MIMO plants. The design problem is first recast into a Static Output Feedback (SOF) controller design problem and then the transformed SOF problem is solved within the framework of Linear Matrix Inequalities (LMIs) through a decomposition of the Lyapunov matrix variable.

I understand the basics of PID design, but if you can't describe the thing being controlled, how can you design the controller other than trial and error? The "plant" is a motor on a tall reducing gear (~300:1) turning an arm that presses on a bag producing an air flow with the loop controlled by a pressure measurement.
