

## Effects Of Ondansetron On Attenuating Spinal Anesthesia

As recognized, adventure as with ease as experience not quite lesson, amusement, as without difficulty as understanding can be gotten by just checking out a ebook **effects of ondansetron on attenuating spinal anesthesia** in addition to it is not directly done, you could assume even more concerning this life, something like the world.

We pay for you this proper as competently as simple exaggeration to acquire those all. We allow effects of ondansetron on attenuating spinal anesthesia and numerous ebook collections from fictions to scientific research in any way. in the course of them is this effects of ondansetron on attenuating spinal anesthesia that can be your partner.

Questia Public Library has long been a favorite choice of librarians and scholars for research help. They also offer a world-class library of free books filled with classics, rarities, and textbooks. More than 5,000 free books are available for download here, alphabetized both by title and by author.

### Effects Of Ondansetron On Attenuating

Abstract. Hypotension and bradycardia are common adverse effects following spinal anesthesia. Ondansetron has been studied in the attenuation of spinal anesthesia- induced hypotension (SIH) and bradycardia because of its antagonistic effect on the Bezold-Jarisch reflex. The purpose of this systematic review and meta-analysis of randomized controlled trials (RCTs) was to determine the efficacy of intravenous (IV) ondansetron in reducing the incidence of SIH and bradycardia.

Ondansetron blocks the actions of chemicals in the body that can trigger nausea and vomiting. Ondansetron is used to prevent nausea and vomiting that may be caused by surgery, cancer chemotherapy ...

## **Ondansetron (Oral) - Side Effects, Interactions, Uses ...**

In the last 10 years, more than 150 studies were published describing the effect of ondansetron on the prevention of hypotension during spinal anaesthesia, as well as bradycardia. The mechanism of ondansetron's activity is attributed to blockage of serotonin receptors (5-HT<sub>3</sub>), resulting in the interruption of the cardioinhibitory Bezold-Jarisch reflex from chemoreceptors.
